

Category:NOAA_Office_of_Climate_Observations

The NOAA Office of Climate Observations (OCO) is working with NOAA's National Geophysical Data Center (NGDC) to increase access to and understanding of ocean observations using international metadata standards. To start this process, experts at NGDC are creating ISO 19115-2 metadata records from existing documentation available on the web. These initial records will be shared with the groups collecting the observations and improved by editing and adding content. The pages on the wiki facilitate communication between participants by providing descriptions of how the standards are being used to document the observations.
